

TITLE: INCLINED SUPPORT-DISPLAY ASSEMBLY AND BRACKET THEREFORE

ABSTRACT

An inclined support-display assembly for installing in an article of furniture having a pair of vertically opposed end panels. Each end panel is provided with two columns of equally spaced perforations. The diameter of each perforation and a distance between two consecutive perforations are conventionally predetermined. The support-display assembly comprises a pair of support subassemblies, each one including a pair of brackets assembled with a tubular element for use together with the end panels. Each bracket incorporates a flat base having rear and front faces and two pins projecting from the rear face, closely to one extremity of the flat base. Both the diameter of each pin and a distance between the two pins are commensurate with both the diameter of each said perforation and the distance between two consecutive perforations.
